Requested Indication: Moderate-to-severe plaque psoriasis (L40.0)
Current Body Surface Area (BSA) Involved: 16% (measured 05/28/2026)
Affected Areas: Extensor surfaces of elbows, knees, scalp, back
Prior Systemic Therapy:
- Methotrexate 15 mg PO weekly from 01/10/2026 to 05/10/2026 (16 weeks)
  * Baseline BSA: 20% on 01/05/2026
  * Post-treatment BSA: 2.0% on 05/10/2026 (achieved clearance)
Handwritten note: Please note patient flare after tapering steroids.

EXCERPT OF EARLIER DENIAL LETTER (Ref # XXXXXXXX, dated 03/15/2026):
"Coverage for Skyrizi was denied: Step therapy requires trial of adalimumab
prior to consideration of preferred interleukin inhibitors."
Prescriber Signature: Dr. Teresa Gomez, MD (fictional) 06/22/2026

DERMATOLOGY ASSOCIATES OF THE VALLEY (fictional) - ENCOUNTER NOTE
Patient: Raylan Cheung (fictional) | Age: 45 | MRN: XXXXXXXX
Encounter Date: 05/28/2026 | Provider: Dr. Teresa Gomez, MD (fictional)

REASON FOR VISIT: Severe flare of moderate-to-severe plaque psoriasis.
HISTORY: 45yo male with long-standing moderate-to-severe plaque psoriasis. Patient was on oral methotrexate 15 mg weekly which cleared plaques down to BSA 2.0% as of 05/10/2026. Medication held due to transaminitis. Since stopping, patient has experienced a rapid rebound of plaques.
PHYSICAL EXAMINATION (05/28/2026):
Skin: Well-demarcated erythematous plaques with thick silvery scale on elbows, knees, back, and scalp. Total BSA involvement is 16%.
ASSESSMENT & PLAN:
1. Moderate-to-severe plaque psoriasis - recurrent flaring.
   - Prescribe Humira (adalimumab) 40 mg subcutaneous injection weekly.
   - Submit PA for adalimumab maintenance.
Dr. Teresa Gomez, MD (fictional) - Signed electronically 05/28/2026
